

MEADOWAY COLOURS

Meadows can be very colourful places! Discover the world of colour in plants and animals as you explore The Meadoway!

Remember: don't pick anything—living or dead—and stay at the edge of the meadow while you're looking so you don't disturb the animals' habitat (home).

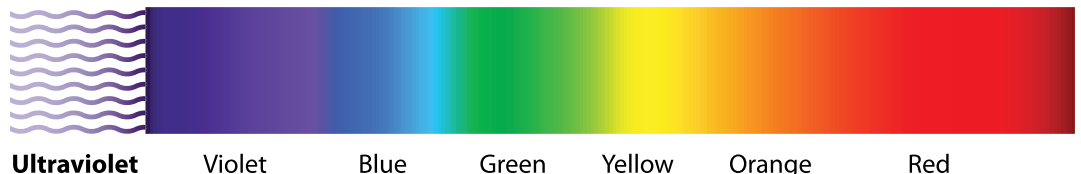

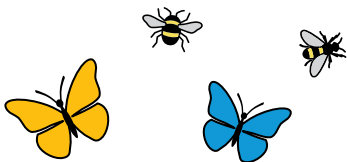

These are the colours humans can see in the world. Which ones do you see in nature? Check off what you see while exploring The Meadoway!

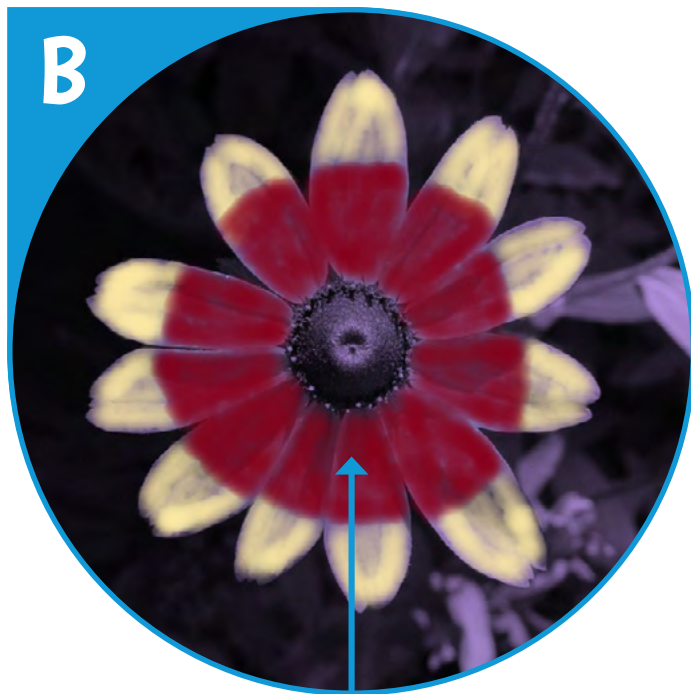

Other animals may see the world differently! Rabbits can only see blues and greens, and squirrels only see blues and yellows.

How about bees and butterflies? Well, they see some colours we see, but they also see extra light that we don't see! It's kind of like a secret code that plants show only to wildlife!

Matching Activity

Ultraviolet insect code!

The images above show two different ways of seeing the same flower. Match the animals below (human, bee, etc.) to the way they see the Black-eyed Susan flower above (write 'A' or 'B').

Remember: many insects can see ultraviolet "secret codes" in flower petals.
